

1. A DC power source comprising:
a plurality of chambers having walls that are electrically
non-conductive;
a liquid within said chambers;
an electrode pair disposed within said chambers, one
electrode of each pair having a positive electromotive force and
the other having a negative electromotive force; and
means for refreshing said liquid.

2. The power source of claim 1 wherein one of said chambers
has an entry port for said liquid at one end and an exit port for
said liquid at an opposite end, said means for refreshing
additionally comprising a valve that is connected to said entry
port, said valve being operable to provide a flow of liquid
through said entry port.

3. The power source of claim 2 additionally comprising
means for providing an air tight separation between said exit
port and an exterior of said chamber, in an absence of fluid
pressure caused by said flow of liquid.

4. The power source of claim 3 wherein said means for providing comprises:

a panel;

a hinge that has two sides that are rotatable with respect
5 to each other one side of said hinge being connected to said
panel and the other side being connected to said exit port to
cause said panel to be moveable to cover said exit port and
provide said air tight separation.

5. The power source of claim 3 additionally comprising means for discharging from said power source liquid at the exterior of said chamber.

6. The power source of claim 1 wherein said liquid is tap water.

7. The power source of claim 1 wherein said electrodes having said positive and negative electromotive force are copper and zinc, respectively
